PROFESSIONAL SUMMARY

Data Engineer with strong foundation in building scalable ETL pipelines, data transformation, and analytics solutions. Expertise in Python, SQL, and cloud-based data warehousing using GCP. Proven experience processing large datasets (2M+ records), implementing data quality frameworks, and creating business intelligence dashboards. Skilled in both data engineering infrastructure and analytical insights delivery.

TECHNICAL SKILLS

Data Engineering: ETL Pipelines, Data Modeling, Data Warehousing, Data Lakes, Apache Spark (PySpark), Real-time Data Processing, Data Quality & Validation

Programming & Frameworks: Python, SQL, Pandas, FastAPI, Flask, SQLAlchemy

Databases & Storage: PostgreSQL, SQL Server, Data Warehouse Design, Query Optimization, Database Performance Tuning

Cloud & DevOps: Google Cloud Platform (GCP), Cloud Storage, Docker, Git, CI/CD

Analytics & Visualization: Power BI, Statistical Analysis, Seaborn, Business Intelligence

Machine Learning: XGBoost, Predictive Modeling, Feature Engineering, Model Deployment

PROJECTS

Real Estate Data Pipeline & Analytics Platform

Python | Pandas | Power BI | GCP | PostgreSQL | Data Warehousing | Seaborn

- Architected end-to-end ETL pipeline processing 2M+ records (178MB) from USA Real Estate Dataset with complete data transformation workflow
- Designed and implemented cloud data warehouse on GCP with optimized schema for analytical queries and remote access
- Built comprehensive data quality framework including validation checks, anomaly detection, and automated error handling
- Reduced query response time by 40% through indexing strategies, partitioning, and SQL optimization techniques
- Developed interactive Power BI dashboards delivering real-time market insights with drill-down capabilities for stakeholders

IoT Data Engineering & ML Pipeline for CO₂ Monitoring

Python | FastAPI | PostgreSQL | MQTT | XGBoost | GCP | Pandas | Real-time Streaming

- Engineered real-time data streaming pipeline for IoT sensor data using MQTT broker integration with aiomqtt for asynchronous processing
- Designed PostgreSQL database schema for time-series data storage with efficient partitioning for historical analysis and ML training
- Built machine learning pipeline with XGBoost for predictive risk classification based on CO₂ concentration patterns in fermentation
- Implemented feature engineering and data preprocessing workflows including outlier detection and temporal feature extraction
- Deployed on GCP infrastructure with automated data pipelines and REST API endpoints for real-time monitoring dashboard

X Bookmarks Data Management System

FastAPI | PostgreSQL | SQLAlchemy | Data Modeling | API Development

- Designed normalized PostgreSQL database schema for efficient bookmark storage, categorization, and retrieval with relationship management
- Built RESTful API with FastAPI enabling CRUD operations, data validation, and authentication for structured data access
- Integrated OAuth 2.0 authentication with X API for automated data ingestion and synchronization workflows

EDUCATION

Bachelor of Science in Software Engineering

University Name | Expected Graduation: 2026 - August

ADDITIONAL INFORMATION

- Open to remote opportunities and relocation
- Fluent in English (B2) and Spanish
- Seeking Junior Data Engineer, Data Analyst, or Junior Data Scientist positions
